Abstract

This Manual describes the NETED text editor as implemented on the CDC CYBER Computers at DTRC. NETED is used to prepare computer programs, data files, documents and other publications. Each of the 61 NETED commands is described on a separate page, as well as in the cross-referencing summary by function. A discussion of the history of NETED and its many features, a sample annotated session, and a list of all diagnostic messages are included.

Administrative Information

The work described in this report was performed in the Software Branch (1893) of the Computation, Mathematics and Logistics Department, David Taylor Research Center, under the sponsorship of the DTRC Computer Center (189).

Mr.

Trapes in the land of

***** Introduction *****

*** NETED at DTRC ***

NETED for the CDC Computers was acquired from Ed Fourt of Lawrence Berkeley Labs, implemented by the Construction Engineering Research Laboratory (CERL), Computer Services Branch, and is maintained by DTRC. CDC NETED is written in Fortran IV Extended, version 4, and Compass (assembly language).

NETED has several advantange over the standard Intercom EDITOR. They include:

- () low cost -- inexpensive to use;
- . does not require line numbering ;
- allows the merging of files,
- ; allows much longer search and replacement strings
- supports full ASCII upper and lower case files *
- is not a multi-user job; if it does hang, it may be aborted.
- . uses only a small amount of memory (currently under 21K octal).

In 1979, NETED was re-written in Algol for implementation on the Burroughs 7700 computer at DTRC. This version performed as it did on the CDC computers, providing a common editor on Computer Center computers. In addition to the CDC NETED commands, new commands and capabilities were added, increasing the number of commands to 115 and included file backup, system and NETED fault recovery, and many other features.

The last released version of CDC NETED was version 1.4 in March 1981. Work was begun on version 2.0, which was to include a new execute statement and several more commands and features. However, a combination of higher priority work and some implementation problems delayed its release. With the prospect of new computers replacing the CDC CYBERs, version 2.0 never got beyond the test phase.

Since the installation of the replacement computer system has been delayed, the CDC CYBERs will be retained at least a year longer than planned. It was decided to release most of the version 2.0 commands and improvements.

This is expected to be the last released version of NETED.

* - NETED's ASCII is not compatible with the rest of NOS/BE. After having used NETED for so many years, it would not be practical to change this now.

ERALECT SECONDO SCIENCES

*** Executing NETED ***

To execute NETED, version 2:

ATTACH, NETED2
NETED2, <1fn>, <type>, <def trunc_len>

where

<lfn> the local file to be edited. One of:

- . a local file
- . an attached permanent file (may not be overwritten)
- . a non-existent file (to create a new file)

<type> the type of file you are editing; defines the tab columns;
sets writes to a permanent file (PF) or queue (Q) device;
defines the default truncation length; sets the TRUNC
toggle. One of:

value	type	PF/Q	tabs +inc	def_trunc_len
omitted	DATA	PF	7	140
A	ASCII	PF	none	140
С	Cobol	PF	4, 8, 12 +4	72
D	Data	PF	none	140
ŀ	Fortran	PF	7, 10, 13 +3	72
J	Job	PF	none	80
M	coMpass	PF	11, 18, 36 +3	72
P	Pascal	PF	3, 5, 7 +2	72
Q	Q-file	Q	none	140
R	Ratfor	PF	3, 6, 9 +3	72
T	Text	PF	6, 10, 14 +4	80
X	fortran	PF	7, 9, 11 +2	72

<def trunc len>

the default truncation length; overrides the length implied by <type>; sets the TRUNC toggle. If <def_trunc_len> is 0 or invalid, it is set to the maximum line length (140).

Default: that implied by <type>

If <type> and <def_trunc_len> are omitted, the default truncation length is set to the maximum line length and the TRUNC toggle is reset.

*** Leaving NETED ***

To leave NETED, you must be in Edit Mode. Use the '.' toggle to go from Input Mode to Edit Mode, if necessary. Then type SAVE or QUIT to leave NETED.

*** All Those NETED Commands ***

Don't let the number of NETED commands scare you! After you become familiar with the basic commands, then try a few more. Eventually, you will probably settle on a group which will meet most of your editing needs.

Many commands have similar functions. For instance, consider the search commands. There are two types (the search string must begin in column 1 (F), or in any column (L)). For each of these, the search may be forward or backward (the next letter is B: FB, LB); each of these will search to the next line which meets the test. By adding A to any of the four (FA, FBA, LA, LBA), all lines meeting the test may be listed. Thus, we have 8 search commands: F/FA/FB/FBA, L/LA/LB/LBA.

Similarly, there are four basic ways to write the workfile to disk:

- 1) from top-of-file to the current line (WTOP)
- 2) from the current line for a number of lines (WL)
- 3) the entire workfile (W, SAVE).

The NETED commands are grouped below in 4 levels:

- level 0 -- basic commands
- level 1 -- intermediate commands
- level 2 -- advanced commands
- level 3 -- specialized commands

Level 0 (basic):

A/AR	Append (Add on the Right)
В	go to the Bottom of the file
С	Change one string to another
D	Delete lines
F	Find forward (starting in column 1)
FB	Find backward (starting in column 1)
Н	list the commands at the terminal
I	Insert a line
L	Locate forward (in any column)
LB	Locate backward (in any column)
N	go N lines forward or backward
P	Print lines
QUIT	QUIT NETED, do not save the edit file
R	Replace a line
RA	print a RAnge of lines around the current line
RC	Repeat the last Change
SAVE	SAVE the edit file and quit NETED
T	go to the Top of the file
W	Write the entire edit file
-	go back one line (same as N -1)
<cr></cr>	(carriage return) go to next line (same as N 1)
•	<pre>(period) switch mode (Edit-to-Input or Input-to-Edit)</pre>
*	(asterisk) switch "E:"/"I:" prompting on and off

88/01/06 Page 1-4 Rev0

Level 1 (intermediate)

Add on the Left of the line DTOP Delete lines from top-of-file TO (but not including) the current line (the Pointer) DUP DUPlicate the current line Find forward All occurrences (starting in column 1) FA **FBA** Find Backward All occurrences (starting in column 1) Locate forward All occurrences (in any column) LA LBA Locate Backward All occurrences (in any column) LN list the Line Number of the current line M Merge a file at the pointer Print All lines

PA

STAB Set TAB character and columns

UC Undo the last Change

V set/reset the Verify toggle

WL Write Lines to a file

WTOP Write lines from top-of-file TO the Pointer to a file

Level 2 (advanced)

J Join two lines with one space between JN Join two lines with No space between K/KL Keep the Left-most columns KR Keep the Right-most columns PD Print lines Double-spaced PDA Print All lines Double-spaced SL Shift lines to the Left (same as TL) SR Shift lines to the Right TL Truncate lines on the Left TR Truncate lines on the Right

*** Files and Operation ***

The file to be edited must be a local file; it cannot be connected to your terminal. If it is an attached permanent file, NETED will not allow it to be overwritten. If the file does not exist, NETED will put it onto a permanent file device (*PF), or a queue device (*Q) if "NETED,...,Q" is used, when it is written. To change the destination for future writes, use the PF and Q commands.

** End-of-record and End-of-file **

NETED edits files which contain record marks. When a file is brought under NETED, each record mark is turned into a line consisting of only "EOR" (end-of-record) or "EOF" (end-of-file) as appropriate. In addition, NETED will delete a single trailing EOR, a single trailing EOF, or a trailing EOR/EOF pair.

** Output Files **

When output, each line consisting solely of "EOR" or "EOF" (in columns 1-3) is converted to its equivalent record mark. An end-of-record is always written at the end.

The file being written is rewound before and after writing, thus replacing any previous contents.

An attached permanent file cannot be overwritten.

*** NETED Modes ***

NETED works in two distinct modes -- Input Mode and Edit Mode. In Input Mode, lines are read from the terminal and entered directly into the edit file. A line consisting of only a period (".") has a special meaning -- switch to Edit Mode.

In Edit Mode, there are a number of commands which allow you to locate lines; add, delete and replace lines; change parts of lines; move your point of interaction with the file ("the Pointer"); insert an entire file at any point in the edit file; save the edit file; and make a copy of all or part of the edit file into another file.

*** Pointers vs Line Numbers ***

NETED is a pointer-oriented editor, unlike the CDC NOS/BE editor, (called EDITOR), which is line-number oriented. With EDITOR, each line must be referred to by its line number. Gaps are left for inserting additional lines. If there is insufficient room, the EDITOR file must be resequenced to make room.

TEXTERNAL PROPERTY INCORPORT FOR POSSESSION FOR PROPERTY INCORPORT FOR POSSESSION FOR POSSESSION

STANDARD EGGSTATE BANKSON FAX

** The Pointer **

In NETED, your file is conceived of as beginning at the top and extending to the bottom, or end. There is a conceptual pointer, which indicates the current line in the file. If you wish to alter a line, you must first set the pointer on it. When you insert a line, the new line goes after the current line and the new line becomes the current line. The NETED command starts you off with the pointer at the top of your file. When you change between input and Edit Mode — in either direction — the pointer does not move. To see which line the pointer is on, just type "P" (in Edit Mode).

The file should not be thought of as circular, in that there is a real difference between having the pointer at the top of the file and having it at the bottom. The top is not the next position after the bottom.

*** More on the <BOTTOM> and the <TOP> ***

In NETED, your file contains two pseudo-lines, the <TOP OF FILE>, and the <BOTTOM OF FILE>. These represent the position of the pointer when it lies just in front of the first line in the file, or just after the last line in the file, respectively. A line inserted with the pointer at the top will go in front of the previous first line -- a line entered at the bottom goes at the end of the file. The pointer then points to the line just entered, and the bottom would be just below it.

Since the top and bottom positions are not really lines, Edit Mode commands which attempt to change them have no effect.

*** Toggle Switches ***

NETED has three commands best thought of as reversing the position of toggle switches. The period is an example. It simply says "change modes". The mode you get depends upon which mode was in effect when the command was issued. Issuing a toggle-type command twice just leaves things as they were. The other toggle-type commands are: V (turns on and off the printing of some commands), and * (turns on and off the NETED prompt of E: or I:).

*** Terminal Output -- Optional Responses ***

Most of NETED's edit commands produce some kind of printing at your terminal in response. NETED insists upon giving some of these responses, but allows you to disable the printing of others. Those which can be disabled are called "optional responses". The printing or suppressing of optional responses is controlled by the toggle switch command "V". The commands which generate optional responses are the next, locate/find, change, repeat change, undo change commands.

*** Command Format ***

In Edit Mode, NETED will recognize and execute commands from the list in Chapter 2. These commands have one of the following formats:

<command>
<command> <command>

A blank space must separate the <command> from the <parameters> only if the parameter starts with a letter, "?", ".", or "*". Otherwise, <parameters> may follow the command immediately. <Parameters> must be integers or alphanumeric text. In the following, <n> will indicate an integer parameter, <string> will indicate a string of text. A "\$" is allowed as an integer parameter, and is a shorthand notation for a very large number, which will force most commands to execute to the bottom of the file. Integers which represent a "number of lines" may be preceded by a minus sign ("-") to indicate that after execution of the command, the pointer is to be returned to the line where it started the command.

*** Strings in NETED ***

NETED identifies <string>s in one of two ways. In the "C" command, the <string>s are delimited by a character (except blank) which is not in either <string>. In all other string commands (A/AR, AL, F/L/etc., I, R), the <string> starts after the first blank after the <command> and continues through the last non-blank.

After a <string> has been defined for a particular string command, it may be referenced later as the <string> in any other string command by using an "escape sequence". An escape sequence is the "escape character" (see the ESC command) followed by a single digit. (An escape character is needed because NETED cannot detect the ESC key.) The following are the recognized escape sequences (<e> represents the escape character; default: backslash ("\")):

<e>0 - the most recent F/FA/FB/FBA/L/LA/LB/LBA <string>

<e>l - the most recent C <stringl>

<e>2 - the most recent C <string2>

<e>3 - the most recent AL <string>

<e>4 - the most recent A/AR <string>

<e>5 - the most recent I <string> or the last Input Mode line

<e>6 - the most recent R <string>

<e>7 - the second line of the most recent J or JN

<e>8 - the last line printed by P

*** Line Lengths ***

In NETED, text lines, commands, and patterns may be 140 characters in length.

25255 PXC • 1225

*** Input Mode ***

In NETED's Input Mode, every line entered is taken to be a new line of text to be added to the file at the current position. The pointer is always at the last line of text entered. The one exception is that a line of text which consists of just a period (".") in column 1 is taken as the command to leave Input Mode. If you enter Edit Mode commands while in Input Mode, the commands are accepted as text.

If you enter lines in Edit Mode with the "I" or "R" command, the first two columns are taken up with the command letter and the blank following. Because of the confusion of which column you are in, tabs work only in Input Mode, where the columns you type in correspond to the columns in the text.

NOTE

If a command seems to take forever to execute, it may be that you are really in Input Mode. When NETED enters Input Mode, it displays "INPUT." at your terminal. It indicates Edit Mode by displaying "EDIT.". If in doubt, use the period (".") toggle to see where you were.

*** Interrupting NETED ***

Any command which is printing may be interrupted by hitting a key to interrupt it and typing %S to ignore the current print buffer. It may be necessary to repeat this several times if a large number of lines are printing.

If you terminate NETED by %A, your edit file is lost and cannot be recovered.

*** Special NETED Files ***

NETED uses the following three files:

\$CONSOL - for displaying at your terminal

\$KEYBRD - for terminal input

ቊዀፘቊጛቊ**ፚኯፚኯፚኯፘኯ**፝ፘዸ<mark>ፘፘ</mark>ዸፘቔፙቔፙቔኇኯኯኇኇኯኯ

NETRNDM - the random edit file

They are returned by NETED at normal termination.

A Com

PRODUCED PROGRAMMI PROGRAMM

17 XXXX

*** A Word About Automatic Line Truncation ***

While the longest line possible in NETED is 140 characters, you can have NETED truncate lines earlier. This is especially useful when creating or modifying a program, since compilers ignore all characters after column 72. The "right margin" is used to define the truncation length. Truncation can occur with any command (except CENTER, LEFT, and RIGHT) which changes or inserts lines, including Input Mode; it will NOT occur when lines are read from or written to a file.

If, when you enter NETED, you specify the <type> parameter, the initial and default truncation lengths are defined as one of:

- . 72 (<type>=C, F, M, P, R, X (the languages))
- . 80 (<type>=J or T (job or text and documents))
- . 140 (<type>=A, D, Q, or omitted (ASCII, data and queue files) If the <def_trunc_len> parameter is specified, its value overrides that implied by <type>.

Whether truncation takes place is determined by the setting of the TRUNC toggle. If set, lines are truncated at the right margin; if reset, lines are truncated at the maximum line length (140). When NETED is started, the TRUNC toggle is set if <type> is A, C, D, F, J, M, P, Q, R, T, or X, or if <def_trunc_len> is specified. If both <type> and <def_trunc_len> are omitted, TRUNC is reset.

To set or reset the TRUNC toggle, use the TRUNC command. To change the truncation length (right margin), use the RM command.

Except for the J and JN commands, truncated data is generally lost and cannot be retrieved.

Both the WHAT command and the NETED prolog will display the default truncation length and whether the TRUNC toggle is set or reset.

*** Compiling and Running a Program ***

Since NETED is only a text editor, you must return to NOS/BE command mode to compile and execute a program.

The following sample session illustrates creating a program, compiling and executing it. These symbols are used to annotate the example:

- s> -- a NOS/BE system response
- n> -- a NETED response
- o> -- user program output
- p> -- a NOS/BE system prompt

***** The NETED Commands Alphabetically *****

All NETED commands have the following syntax:

[<query>] <command> [<parameters>]

where

<query> A question mark ("?") immediately preceding <command>

causes you to be prompted to verify all changes made by the change commands -or- interrogate some setting

in NETED.

<command> The command to be executed.

<parameters> The presence of absence of <parameters> depends on the

individual command. Generally, if the first character of cparameters> is a non-letter (except "?" and space),

then the blank separating it from <command> is not

required.

In the examples in the rest of the chapter, each line is preceded by one of:

u> -- a user entry

--> -- the position of the pointer after successful completion of the command

<nothing> -- displayed output of the command

In addition,

<-- -- indicates a comment.

B (Bottom of file) (Bottom of file) B

B

Rove the pointer to the last line of the file.

Note: NETED at DTRC differs from the specifications for ARPANET editors in the implementation of the B command. At other sites, the B command puts the pointer at the ROTOR OF FILE* Position and puts you into Input Mode. This was considered dangerous since the last line of the file may be a record mark (EGR or EDF), in which case, lines input after the B command would be separated from the rest of the file by a record mark. If the file being edited were a Fortran program, for example, lines appended after an Dol would not be encountered by the compiler — a likely source of constarnation.

Toggles affecting the output of this statement: V.

V set — bottom-of-file displayed
V reset — no output

Pointer after command completion: the last line of the file.

Related or similar commands: T.

Messages: ROTTON OF FILE — or Rottom of File INPROPER NETED ARGUMENT.

Examples:

Decrease of the file of t

C (Change)

(Change) C

<?> C <dlm><string1><dlm><string2><dlm> <nlines> <global>
<?> C <dlm><string1><dlm><string2><dlm> <global> <nlines>

Change the first or all occurrences of <string1> to <string2> in <nlines> lines.

See also RC (Repeat Change) and UC ("Undo" Change).

- <nlines> is the number of lines to be changed. It changes the current
 line and the next <nlines>-1 lines. If <nlines> is a
 dollar sign ("\$"), the change continues to the bottom of
 the file. If <nlines> is omitted, only the current line
 is changed. If <nlines> is preceded by a minus sign ("-"),
 the pointer is returned, after any changes, to it position
 at the start of the change.
- <?> is a question mark ("?"), each change will be displayed and
 one of the following responses most be given:

Y - make the change

C - make the change and continue without question

N - no change, but proceed with the command

Q - no change and quit the command now

If <stringl> is null (<dlm><dlm>), then <string2> is placed in front of the first position of each of the <nlines> lines. (This is similar to AL <string2>, but allows the same insertion to be made in more than one line and allows trailing blanks to be inserted.)

The end of the line is indicated by ending <stringl> with enough blanks to uniquely identify it. For example, to change the final comma to a period in

COPYSF, A, OUT, EOI, LR,

us e

ed Discoved Upperson Depended Upperson. Offerers Areasted Becauses Demokrate Access

c /, /./

This will change only the final comma, since the others are not followed by a blank.

88/01/06 Rev0 Page 2-7

If <string2> is null, then <stringl> is removed from each of the <nlines> lines.

<nlines> and <global> are optional and may be specified in either
order.

Hint: If the options are omitted and the final <dlm> was forgotten, RC will execute the command, eliminating the need to re-type it.

"<e>1" may be used to refer to the most recent "change" <string1> as the <string> in any string command.

"<e>2" may be used to refer to the most recent "change" <string2> as the <string> in any string command.

See page 1-7: Strings in NETED.

See page 1-9: A Word About Automatic Line Truncation.

IN (set paragraph INdentation)

(set paragraph INdentation) IN

IN <ncols>

"IN" has no effect at level 2.0 of NETED.

?IN

Set paragraph indentation relative to LM.

<ncols> may be positive or negative, subject to the restriction that

$$-(LM-1) \ll (RM-LM)$$

If <ncols> is \$ or -\$, the indentation is defined as the largest or smallest value, respectively. That is, (RM-LM) or -(LM-1). If <ncols> is omitted, the paragraph indentation is reset to 0.

Note: <ncols> at this level must be positive or omitted. "IN -2" produces "INVALID NUMBER"; "IN -\$" produces no response.

"?IN" will display the current left and right margins, paragraph indentation, and line width; <ncols> is ignored.

Toggles affecting the output of this statement: V.

14.7

(X).

J

JN

TOTAL MANAGE SECONDA PARAGE SECONDA

Join the current line and the following line inserting one space (J) or no space (JN) between them.

Joining will NOT occur if any of the following conditions is present:

- . the pointer is at top-of-file
- . the pointer is at bottom-of-file
- . the pointer is on the last line
- . either of the lines to be joined is an end-of-record (EOR) or an end-of-file (EOF).

"<e>7" may be used to refer to the second of the joined lines as the <string> in any string command.

If the joined lines are truncated, "I <e>7" will put the second line back in (assuming the right margin is large enough).

HINT

You may prefer to turn the TRUNC toggle off while joining lines, then use DUP, K, and TL to keep what you want of the first line and delete what you don't want of the second. The WHAT command shows the setting of the TRUNC toggle.

See page 1-7: Strings in NETED.

See page 1-9: A Word About Automatic Line Truncation.

Toggles affecting the output of this statement: TRUNC, V.

TRUNC set - truncation at right margin

TRUNC reset - truncation at maximum line length

(Line Number) LN

LN

List the line number of the current line.

LN actually counts the lines from the top of the file, so it may use a bit of time when executed far into a long file.

Toggles affecting the output of this statement: none.

Pointer after command completion: unchanged.

Related or similar commands: WHAT.

Messages: ERROR IN LN.

IMPROPER NETED ARGUMENT.

Examples:

AND THE PROPERTY OF STREET PROPERTY OF THE PRO

LPL (List Page Lengths)

(List Page Lengths) LPL

LPL <page_length>

List page lengths for the document currently in the edit file. The following carriage control (CC) characters in column 1 are recognized:

1 - top of page

blank - print on the next line

0 - double space

triple space

+ - print on the same line

Separate counts are made of all lines which contain only "EOR" or "EOF" and all other lines (they have bad CCs).

Pages greater than <page_length> lines are flagged with an asterisk and a count of the number of extra lines on the page.

If page_length> is preceded by a minus sign ("-"), bad-CC and EOR/EOF
counts for individual pages are not listed. If omitted, 60 is used.

Toggles affecting the output of this statement: V.

Pointer after command completion: unchanged.

Related or similar commands: none.

Examples:

TOTAL: 15 PGS, 724 LINES, (3 TOO LONG)
```

escapsion befores (12022401) best and processes

M (Merge file)

(Merge file) M

M <1fn>

Merge all lines from file <1fn> after the current line.

Lines longer than the maximum line length (140) will be truncated. The TRUNC toggle has no effect on reading from a file.

<lfn> must be a local file. It may be an attached permanent file, but
may not be a file which is connected to your terminal.

If you get an error message after a merge command and cannot see why the file you specified cannot be merged, it is possible that the file is not local to your session (check the spelling of <lfn>). If you still can't find the problem, you might SAVE the file and use the Intercom FILES command to see what files you have. Note that the merge command will create an empty file, if one doesn't exist, which will show in the output of the FILES command.

Note: There will probably be at least a record mark ("EOR" in your file) at the end of the file you merge. In most cases, you will not want this record mark (or file mark, if present). Therefore, NETED will delete a single trailing EOR, a single trailing EOF, or a trailing EOR/EOF pair. If you really want a record mark there, you must insert it or have extra EORs at the end of the merge file. In any case, you should use the "P" command to be sure the last line merged is what you expect. If you find an EOR or EOF and delete it, keep checking until you are satisfied with the merge.

Toggles affecting the output of this statement: none.

Pointer after command completion:

If any lines merged: at the last (or only) line merged into the edit file.

If no lines merged: unchanged.

Related or similar commands: none.

Messages: <1fn> -- CANNOT READ CONNECTED FILE.

RC (Repeat Change)

(Repeat Change) RC

SOME PROMOTED TO THE PARTY OF T

<?> RC <nlines> <globa!>
<?> RC <global> <nlines>

Repeat the last change in a forward direction.

See also C (Change) and UC ("Undo" Change).

<nlines> is the number of lines to be changed. It changes the current
line and the next <nlines>~l lines. If <nlines> is a
dollar sign ("\$"), the change continues to the bottom of
the file. If <nlines> is omitted, only the current line
is changed. If <nlines> is preceded by a minus sign ("-"),
the pointer is returned, after any changes, to it position
at the start of the change.

<?> is a question mark ("?"), each change will be displayed and
 one of the following responses most be given:

Y - make the change

C - make the change and continue without question

N - no change, but proceed with the command

Q - no change and quit the command now

<nlines> and <global> are optional and may be specified in either
order.

See page 1-7: Strings in NETED.

See page 1-9: A Word About Automatic Line Truncation.

STAB <tabl>, <tabl>, <tabl>...+<inc> <-- set tab and stops and tab increment

STAB <tabch> <-- set tab

STAB <type> <-- set pre-defined

stops

STAB <-- reset stops

?STAB <-- display <tabch>

Define the tab character, <tabch>, and up to 30 tab columns, either specifically, or as at least one tab column and an increment.

<type> has the same meaning as in the NETED execute statement. The
following upper case letters are recognized as pre-defined tabs:

A (ASCII) - no tabs (will NOT change the edit file)

C (Cobol) - 8+4 - 8,12,16, 20, 24, 28, 32, 36, 40, 44, 48,52,56, 60, 64, 68, 72, 76, 80, 84, 88,92,96,100,104,108,112,116,120,124

D (Data) - no tabs

F (Fortran) - 7+3 - 7,10,13,16,19,22,25,28,31,34, 37,40,43,46,49,52,55,58,61,64, 67,70,73,76,79,82,85,88,91,94

J (Job) - no tabs

M (coMpass) - 11,18,36+3 - 11,18,21,24,27,30,33,36,39,42, 45,48,51,54,57,60,63,66,69,72, 75,78,81,84,87,90,93,96,99,102

P (Pascal) - 3+2 - 3, 5, 7, 9,11,13,15,17,19,21, 23,25,27,29,31,33,35,37,39,41, 43,45,47,49,51,53,55,57,59,61

Q (Job) - no tabs

R (Ratfor) - 3+3 - 3, 6, 9,12,15,18,21,24,27,30, 33,36,39,42,45,48,51,54,57,60, 63,66,69,72,75,78,81,84,87,90

T (Text) - no tabs

X (Fortran) - 7+2 - 7, 9,11,13,15,17,19,21,23,35, 37,39,41,43,45,47,49,51,53,55, 57,59,61,63,65,67,69,71,73,75

Examples:

- u NETED, <1fn >, C <-- set Cobol tabs (8+4)
- u> ?STAB
 TAB CH=;
- u> STAB F <-- set Fortran tabs (7+3)
- u> ?STAB TAB CH=;
- u> STAB; 6,11,16,21 <-- tab is ";", tabs are at 6, 11, 16, 21, 24, 27, 30, ..., 99
- u> ?STAB TAB CH=;
- u > STAB ^ <-- change <tabch>
- u> ?STAB TAB CH=^
- u> STAB <-- reset the tabs to what was implied by the second NETED execute parameter (in this example)
- u> ?STAB
 TAB CH=^
- u> STAB ~ <-- assuming the above sequence, the tab character is now "~" with tabs at 6, 11, 16, 21, 24, 27, 30, ..., 99
- u> ?STAB
 TAB CH=~
- u> STAB ~ 6+5 <-- tabs set at 6, 11, 16, 21, 27 TABS. ..., 136
- u> STAB; 11+10 <-- the tab character is ";" with 13 TABS. tabs set at 11, 21, ..., 131

STR (list current STRings)

(list current STRings) STR

STR

gard ordered o prevers o stassay o basayes sa sasayes caracel obsessay basayas massayes

STR <cmd>

List the current definitions of the strings which can be remembered by NETED: A/AR, AL, C (2 strings), F/FA/FB/FBA/L/LA/LB/LBA (1 string for all), I, R, P (the last line printed).

The list, which includes the "escape" sequence which may be used to refer to each string, has the following format:

CURRENTLY-DEFINED STRINGS:

<length> ESC 7

<the insertstring>

J/JN

If <cmd> is specified, only that definition is displayed. <cmd> may be one of: A, AL, 'AR, Cl, C2, C (both C strings), F, FA, FB, FBA, I, J, JN, L, LA, LB, LBA, P, or R.

See page 1-7: Strings in NETED.

<the replace string>

Toggles affecting the output of this statement: none.

UC ("Undo" Change)

("Undo" Change) UC

<?> UC <nlines> <global>
<?> UC <global> <nlines>

"Undo" the last change. It is shorthand for C /<e>2/<e>1/
but does not change the values of <e>1 or <e>2.

See also C (Change) and RC (Repeat Change).

<nlines> is the number of lines to be changed. It changes the current
line and the next <nlines>-1 lines. If <nlines> is a
dollar sign ("\$"), the change continues to the bottom of
the file. If <nlines> is omitted, only the current line
is changed. If <nlines> is preceded by a minus sign ("-"),
the pointer is returned, after any changes, to it position
at the start of the change.

is a question mark ("?"), each change will be displayed and
one of the following responses most be given:

Y - make the change

C - make the change and continue without question

N - no change, but proceed with the command .

Q - no change and quit the command now

CAUTION

Use with care because "<e>2" may appear in more than just the places you changed and may cause the wrong string(s) to be changed.

See page 1-7: Strings in NETED.

See page 1-9: A Word About Automatic Line Truncation.

Toggles affecting the output of this statement: TRUNC, V.

***** A Summary of the NETED Commands by Function *****

The following terms are used in the description of NETED commands:

<lfn> A local file. For commands which write a file, <lfn>
cannot be an attached permanent file.

<ncols> The number of columns affected by the command.

In the number of lines to be processed by the command. In most commands, <nlines> may be a dollar sign ("\$"), which represents a very large number (9,999,999). In most commands, if <nlines> is preceded by a minus sign ("-"), the pointer is returned, after processing, to its position before the command was executed.

<ntimes> The number of times the command is to be executed.

<string> Any string of characters. Lower case letters will be converted to upper case (for non-ASCII types). Trailing blanks are not significant.

<stringl> (Change command only) Any string of characters. Lower
<string2> case letters will be converted to upper case (for non-ASCII
types). Trailing blanks are significant.

<?> A question mark ("?") to allow you to verify each change
before it is made.

The general format of a NETED command is:

[<? >] <cmd> [<parameters>]

*** Toggle Switches ***

Page		Command and Description
2-68	TRUNC	Automatic line truncation toggle. (Default: set (if <fmt> or <def_trunc_len></def_trunc_len></fmt>
2-71	v	Verify toggle. (Default: set)
2-79	. (period)	Change-mode toggle. (Input-to-Edit or Edit-to-Input)
2-81	* (asterisk)	Turn NETED prompting (E: and I:) on and off.

- 4-

and measured accesses partition assessed by property

*** Commands Which Move the Pointer ***

*** Without Changing the Edit File ***

Page		Command and Description
2-5	В	Go to the bottom of the file.
2-16	F <string> FB <string></string></string>	Find the next (previous) line containing <string> starting in column 1.</string>
2-30	L <string> LB <string></string></string>	Locate the next (previous) line containing <string> starting anywhere in the line.</string>
2-42	N <nlines> N -<nlines></nlines></nlines>	Move the pointer <nlines> forward. Move the pointer <nlines> backward.</nlines></nlines>
2-43	P <nlines></nlines>	Print lines single-spaced.
2-43	PD <nlines></nlines>	Print lines double-spaced.
2-64	T	Go to the top of the file.
2-42	<cr> (RETURN)</cr>	Go to the next line (same as "N 1").
2-42	- (minus)	Go to the previous line (same as "N -1").

Page 3-4 Rev0 88/01/06

*** Print Commands Which Never Move the Pointer ***

Page	Command and Description			
2-18	FA <string> FBA <string></string></string>	Find all following or preceding lines which contain <string> starting in column 1.</string>		
2-31	LA <string> LBA <string></string></string>	Locate all following or preceding lines which contain <string> starting anywhere in the line.</string>		
2-39	LPL <page_lengt< td=""><td>th> List page lengths of document in edit file.</td></page_lengt<>	th> List page lengths of document in edit file.		
2-45	PA	Print all lines single-spaced.		
2-45	PDA	Print all lines double-spaced.		
2-50	RA <nlines></nlines>	Print a range of lines around the current line.

Message

Cause and Fix

Command

IMPROPER NETED ARGUMENT.

This is a valid command, but there is something wrong with one or more arguments. Re-enter the command correctly.

INPUT.

NETED. .

Indicates that you are now in Input Mode.

INVALID DEFAULT TRUNCATION LENGTH - SET TO MAXIMUM.

NETED

The third execute parameter of the NETED statement (<def_trunc len>) is zero or invalid and has been replaced by the maximum line length.

INVALID ESC ARGUMENT.

The ESC command accepts only a single character. Re-enter the command correctly.

ESC

INVALID NUMBER.

At least one number parameter has an invalid character (only digits, and perhaps a leading minus sign ("-") are allowed.

D, DUP, IN, K, KL, KR, LEN, LM, RA, RM, SL, SR, TL, TR.

-- INVALID RESPONSE. MUST BE ONE OF: Y,C,N,Q. You entered a response other than Y (yes), C (continue), N (no), or Q (quit). Enter one of these four letters.

?C, ?RC. ?UC

INVALID STR REQUEST.

STR

STR recognizes only the following string identifiers: A, A/AR, AL, AR, C, Cl, C2, F, I, L, P, and R, in either upper or lower case. Use a known value or omit it to display all strings.

LFN: <1fn>

LFN, WHAT

A display of the current name of the edit file.

መዘመዘመት መስመት በተመተመታቸው የሚያስከተለ የተመተመ የሚያስከተለ የተመተመ የተመነመ የተመተመ የተመነመ የተመተመ የተመነመ የተመተመ የተመነመ የ

AND THE PROPERTY OF THE PROPER

Appendix B

*** Glossarv ***

Default truncation length

The value (stated or implied) from the NETED execute statement to be used for the initial truncation length / right margin and for resetting the right margin. See page 1-9.

Edit file The file you are editing. It may be an attached permanent file (which cannot be overwritten), an existing local file, or a non-existent local file (which will be created, at your option on a permanent file device or a queue device, when it is written).

Escape character

Certain string commands and the print and join commands remember the strings. They can be referred to in other string commands by using the escape character and a digit. See page 1-7.

Escape sequence

The escape character followed by a single digit used as a complete string in a string command. It refers to a string previously saved by another string command or by the print or join commands. See page 1-7.

Left margin

Used for centering and left-justifying lines.

Maximum line length

The length of the longest line supported by NETED. Currently, this is 140 characters.

Right margin

Used for centering and right-justifying lines. It is also the truncation length when the TRUNC toggle is set. See page 1-9.

Truncation length

Another name for the right margin. When the TRUNC toggle is set, changed lines which are longer than this length are truncated. Except for J and JN, the truncated information is probably lost. It may be hidden in one of the strings which were saved. Use the STR command to display them. See page 1-9.

Appendix C

*** Some Hints on Using NETED ***

1. If you enter NETED and misspell <lfn>, you must be in Edit Mode to continue. If you are in Input Mode, enter a period (".") to go into Edit Mode. Then, either

- a) . enter "QUIT" to leave NETED.
 - . re-execute NETED with <1fn> spelled correctly.
- b) .enter "LFN <1fn>" to change the name of the edit file.
 - . if you are editing an existing file,
 - . enter "M <1fn>" to merge the file.
 - . enter "T" to go to the top of the file.

Appendix D

*** New Features in NETED Version 2.0

The following features of NETED are new at version 2.0:

- There is a new execute statement and only one variety of NETED. NETEDF and NETEDR are now "NETED2, <1fn>, F" and "NETED2, <1fn>, R", respectively. Version 1 of NETED, NETEDF and NETEDR remain available. Throughout this manual, "NETED" refers to version 2, unless otherwise qualified.
- 2. The E> and I> prompts have been changed to E: and I: to remind you that this is the new version of NETED.
- Lines may now be truncated automatically under control of the TRUNC toggle and the right margin (the NETED statement sets the initial values).
- 4. An "escape character" is available to facilitate the entry of previously defined strings in several commands. This character can be changed by the new ESC command. The STR command has been modified to show the associated number to use for substitution. Strings defined in the string commands (A/AR, AL, C, F/L, I, and R) are remembered and may be used in any of these commands. The last line printed by P or PD and the second line of a successful join (J/JN) are also remembered and may be used in the string commands.
- Additional enhanced commands:

LEN - you can now flag long lines.

LPL - you can restrict the output including a display of

only the totals.

STAB - has more pre-defined tab settings; can restore tabs to the default for the <type> parameter used in the execute statement; can display the tab character; can specify one or tabs with an increment; an invalid tab list will not change the current tabs.

TI - now displays the CP time remaining.

TL/TR - you can now truncate more than one line at a time.

WHAT - displays more information.

Additional new commands:

- join two lines with one or no space between.

K/KL, KR - keep the left- or right-most columns.

- display or change the name of the edit file.

PF - all future writes will be to a permanent file

- all future writes will be to a queue device.

SL/SR - shift left or right.

Redering best for the second of the second o

PERSONAL SERVICE OF THE PROPERTY OF THE PROPERTY ASSESSED FOR THE SERVICE OF THE

DTNSRDC ISSUES THREE TYPES OF REPORTS:

- 1. **DTNSRDC reports, a formal series,** contain information of permanent technical value. They carry a consecutive numerical identification regardless of their classification or the originating department.
- 2. **Departmental reports, a semiformal series,** contain information of a preliminary, temporary, or proprietary nature or of limited interest or significance. They carry a departmental alphanumerical identification.
- 3. **Technical memoranda, an informal series,** contain technical documentation of limited use and interest. They are primarily working papers intended for internal use. They carry an identifying number which indicates their type and the numerical code of the originating department. Any distribution outside DTNSRDC must be approved by the head of the originating department on a case-by-case basis.
